SOLUTIONS FOR INDUSTRY

Introduction

Company

VYBO Electric is a Hi-tech manufacturing plant and supplier of industrial electric motors with wide range of products. Manufacture plant is located in European Union in the Slovak Republic in Spisska Nova Ves in the Central Eastern part of the country. We have extensive experience in the production of electric motors and in the design of electric drive itself.

More than 120 years of the electrical industry in our region...

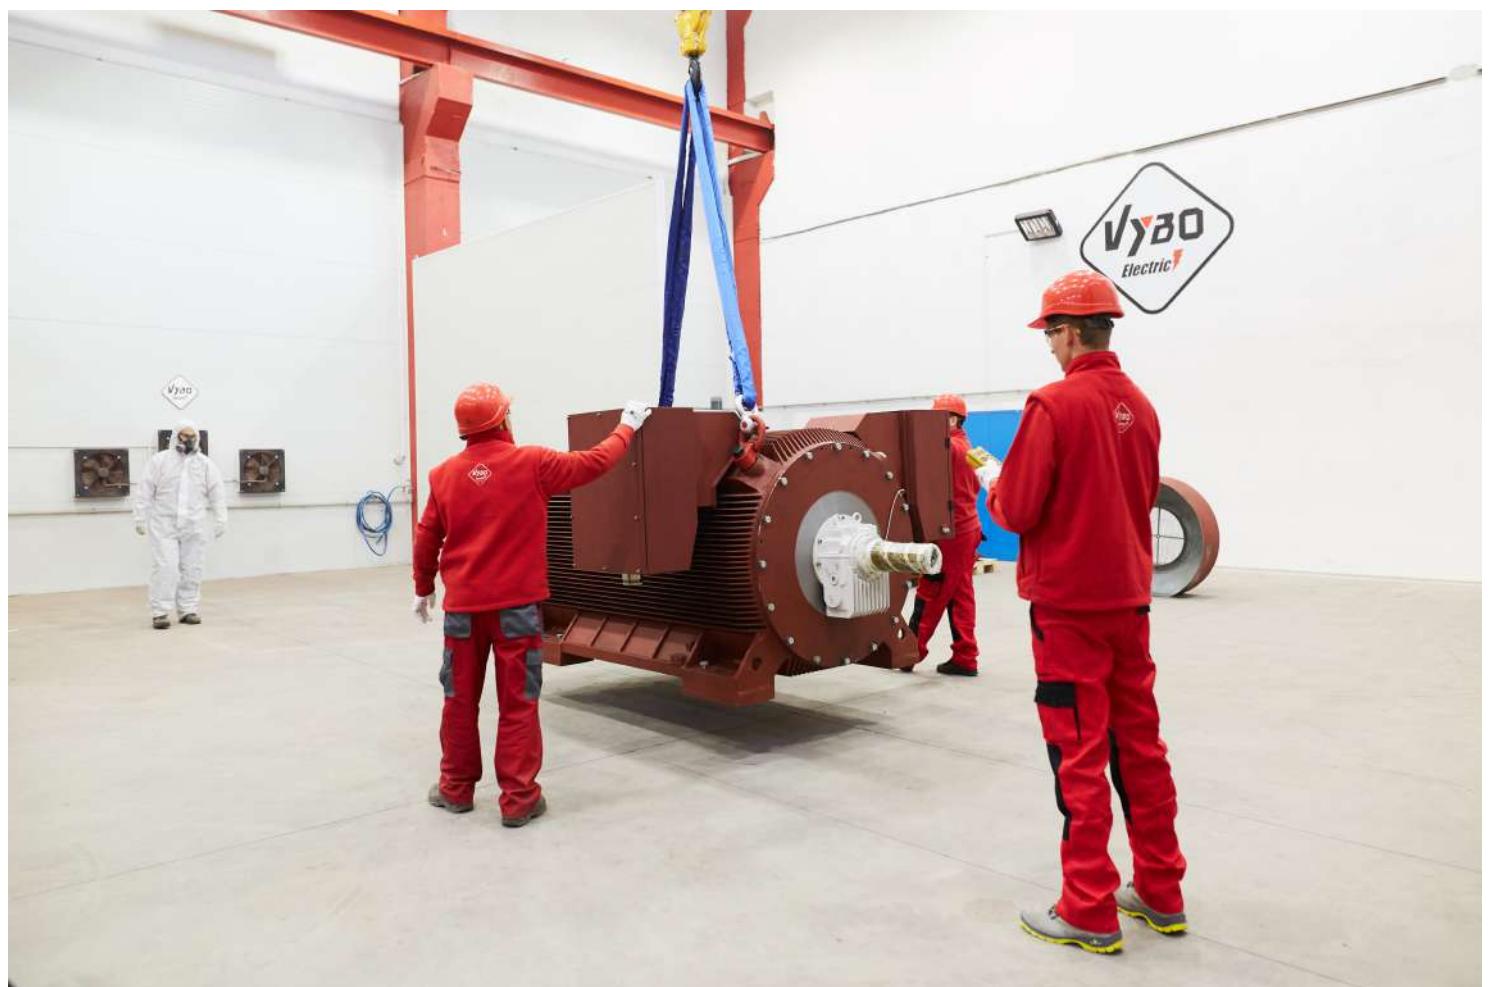

The location has been known for the electrotechnical industry and also for the manufacture of electric motors and electrotechnical equipment for over 120 years. The Slovak Republic is still one of the leading manufacturers of electric and technical equipment.

Maximum quality, maximum flexibility and superfast delivery times...

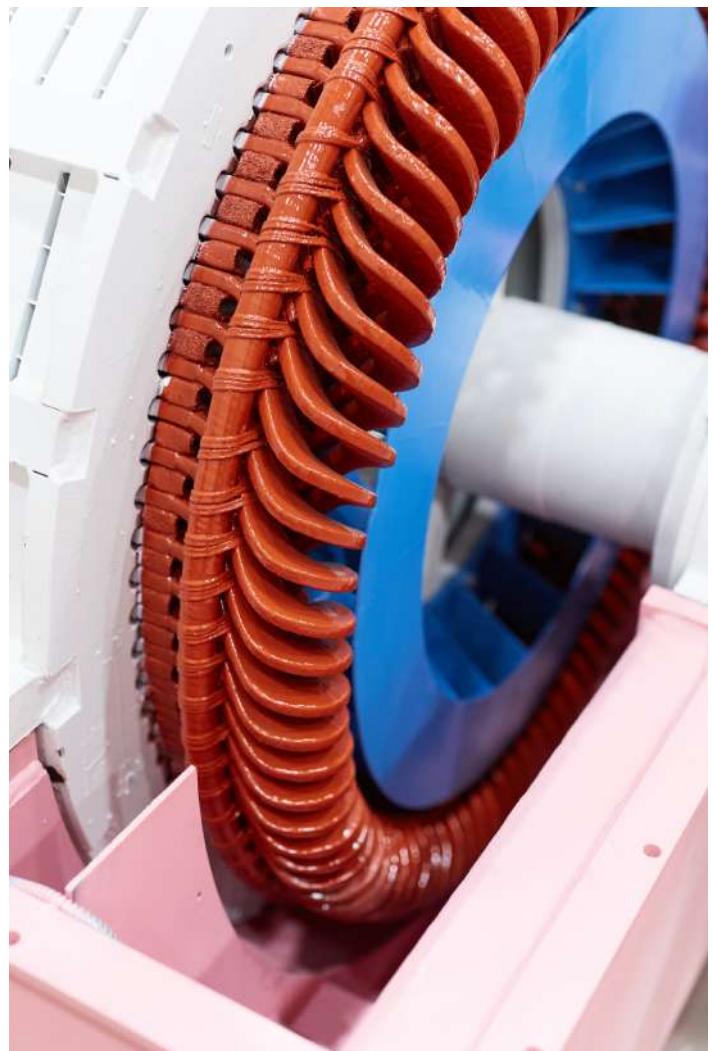

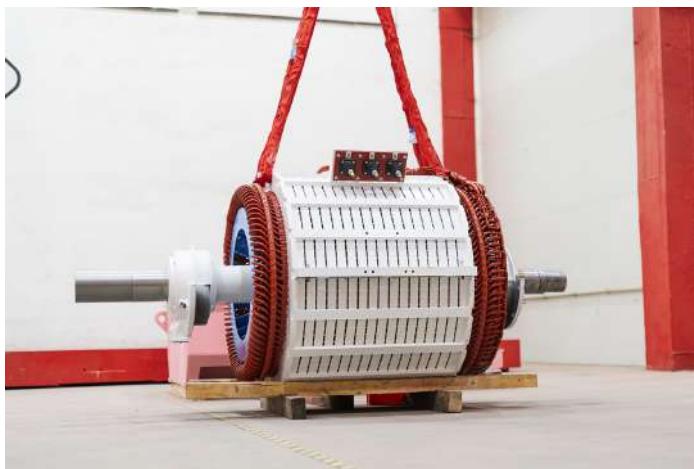

VYBO Electric is a specialist for high-tech, high efficiency big power and high voltage motors. The company is one of the leading suppliers of big power and medium, high voltage motors in European union.

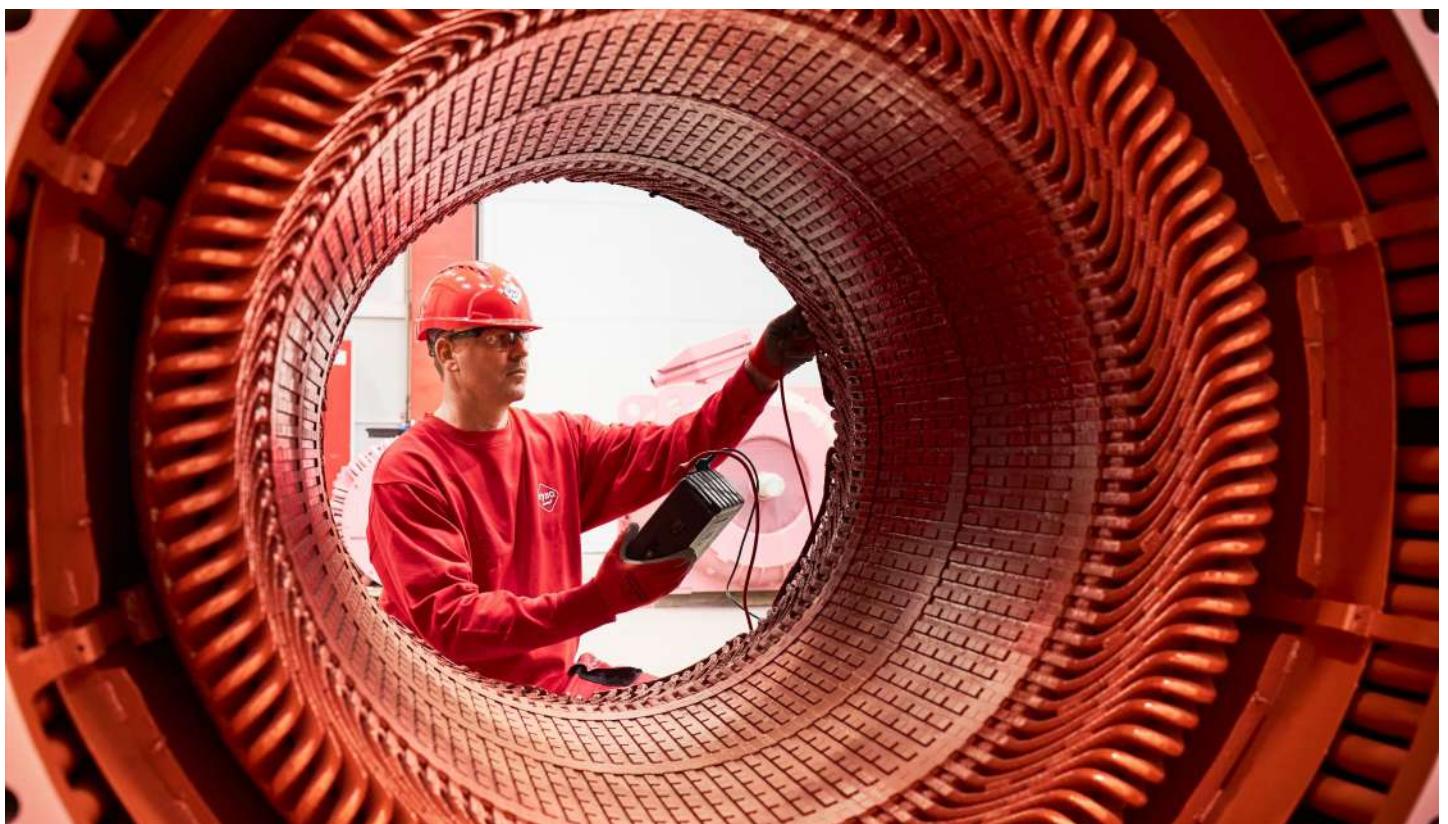

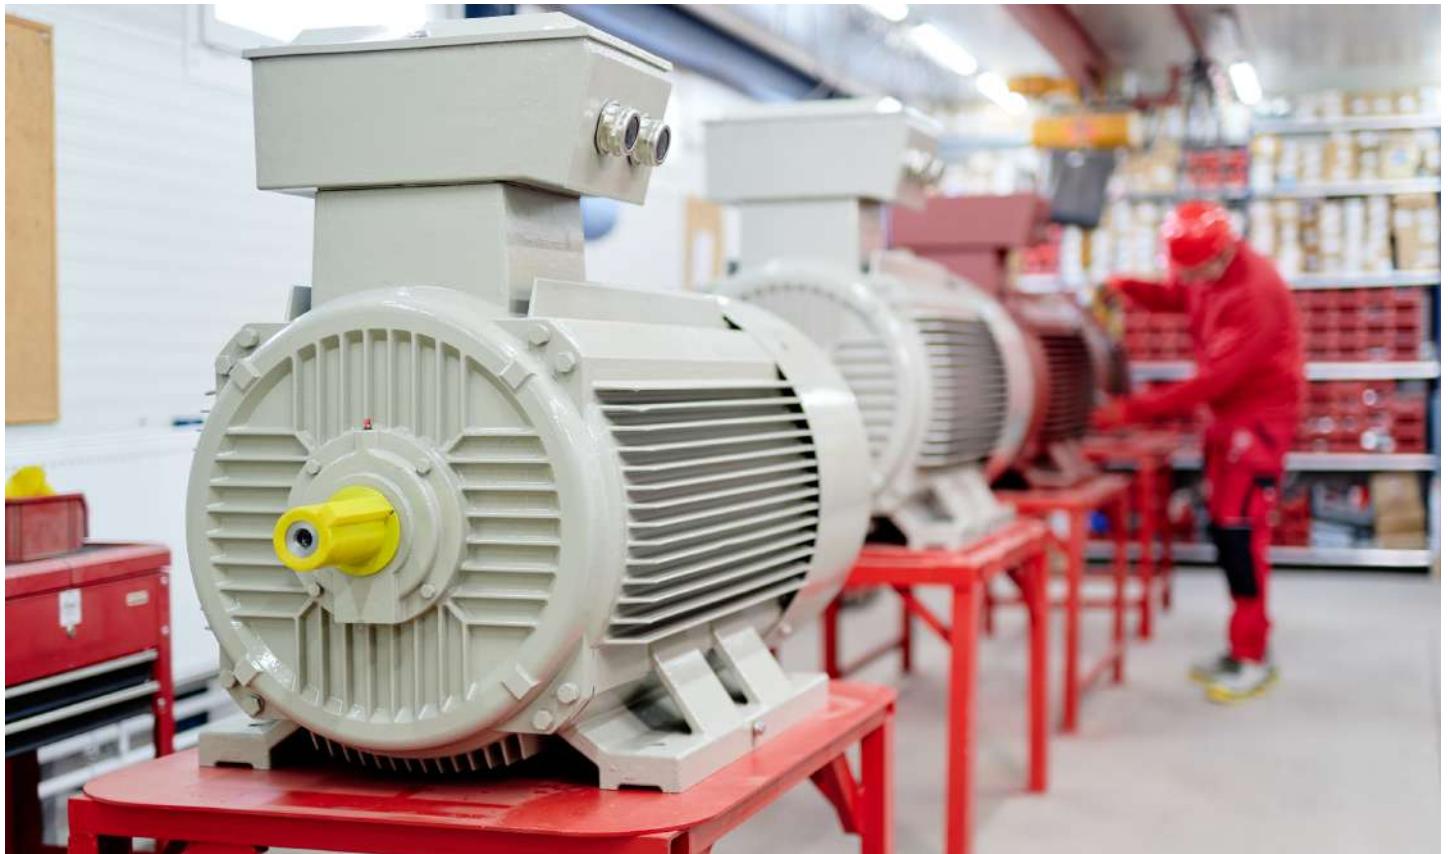

Briefing of construction

A steel plate welded construction has used to reduce the frame weight and increase the rigidity, optimum construction design also makes series motors convenience for installation and maintenance.

One piece laminations for the stator and rotor are precision-stamped form low loss electrical steel, thus the iron loss is minimized and the efficiency is improved.

The insulation class of series motors is class F. The stator coil is a double layer formed coil, the stator core is stacked and assembled with coils outside the frame, coil braces are applied on the circumference of the stator coil ends with spacers inserted between coils to improve rigidity. After the connection between coils is made, the completed stator winding is placed in a vacuum tank and impregnated, then the stator winding is put into the stator frame and fixed with it.

The standard design of the rotor is of copper bar construction, depending on starting conditions, the rotor bar are made of copper or copper alloy. Advanced brazing technology of the rotor bars to the end rings insures mechanical integrity and results in uniform strength and electrical conductivity at the brazed joints. By swaging the rotor bars against the slot sides, the vibrations of rotor bars to electromagnetic force or centrifugal force are eliminated and insure long motor life.

For the frame size below shaft height 500mm, the cast aluminum rotor construction is also possible. Because of the tight fitness between the rotor conductor and slot sides, the heat generated in the rotor conductor is easy to be dissipated, the safety locked rotor time is longer and the permitted moment of inertia to be driven by the motor is bigger.

For 2P motors form H355~H450 and all 4~12P motors, the standard designed series motors adopt anti-friction bearings, self-lubricated with grease or oil according to motor's frame size and operating speed, separate oil supply system is not needed. Split sleeve bearings are used for 2Pmotor from H500~H630 or when specified by purchaser, they are either ring-lubricated or forced-oil lubricated depending upon the loading.

The rotor cores are shrunk onto the shaft and rotor coils are tightly fitted into the slots to minimize vibration. Advanced brazing technology of the rotor coils to coils insures high mechanical strength and good electrical conductivity at the brazed joints. The coil ends are supported by bandage. The rotor winding is vacuum pressure impregnated(VPI) and connected to the slip ring unit. This construction gives the rotor an excellent fit against centrifugal forces.

The slip ring unit is mounted outside the frame to the non-drive end in order to provide easy maintenance without disassembling the motor. As a result, the bearing are closer together, preventing any vibration. Carbon dust, caused by brush wear, is prevented from entering the motor due to the unit. The slip ring unit has a shaft mounted fan and an easily removable and washable filter located in the slip ring housing to collect the carbon dust caused by brush wear.

Quality management and certificates

VYBO Electric is a modern High-tech energy saving company that pays high attention to quality, environment, safety and precision and efficiency of work and energy in production. Therefore, it holds a lot of certificates and quality control systems. **Our priority is quality control.**

Basic certificates include:

ISO9001

The primary task of the ISO 9001 standard is to focus on system management and quality management in the organization. The satisfaction of the customer and the fulfillment of his requirements, which are specified in contracts, orders, or technical drawings, are in the first place. The quality management system is linked to all processes in the company. The standard focuses on the management of human and financial resources, on the stability of infrastructure, including buildings, transport, hardware, software and other communication or information technologies. An important part is also the planning of production and services, the management of the purchasing process, but also the management of non-conforming products.

ISO14001

The main priority of the ISO 14001 standard is to identify and understand the environmental aspects and activities that are related to the entire infrastructure of the company and, based on this, to regulate the environmental impact on the environment.

In its scope, the ISO 14001 standard creates the conditions for determining environmental goals and plans, the fulfillment of which is examined at regular intervals by top management and also by an independent body during internal audits.

This standard is intended for all organizations and companies that consider environmental protection as their primary goal.

The benefit of the standard for society is mainly:

- control over the environmental impact on the environment
- control over produced emissions and waste
- saving material and energy
- prevention of accidents
- compliance of the company's activities with legal requirements
- zero fines for environmental behavior
- creation of a good reputation and prestige of the company

The ISO 45001

Specification (formerly known as OHSAS 18001) is an internationally recognized standard that declares compliance with the principles of a safe enterprise, managing risks at work and protecting the health of workers during work. It does not only concern danger and accidents, but also emphasizes other aspects such as the good condition and mental well-being of the employee.

The certificate is held in Slovakia as STN ISO 45001:2019 and is under the title Management systems of safety and health protection at work. Requirements with guidance for use. It replaces the STN OHSAS 18001 standard.

ISO50001

Energy management systems Energy efficiency help organizations save money, save energy resources and also help to prevent climate change. ISO 50001 encourages organizations in all sectors to use energy more efficiently through the development of an energy management system. The international standard ISO 50001: 2011 specifies the requirements for building, maintaining and improving the energy system. It aims to enable organizations to implement a systematic approach that will help achieve lasting improvements in energy efficiency, energy use and consumption.
